

Principal's Report

Executive Summary

This analysis examined student performance to identify factors that affect academic scores and determine at-risk students. The results show that parental education and test preparation have a positive impact on performance. Several students were identified as at-risk and may benefit from additional academic support.

Key Findings

1. Students who completed the test preparation course scored higher on average.
2. Reading and writing scores showed a strong positive correlation.
3. Students with highly educated parents generally performed better.
4. Female students performed better in reading and writing, while male students performed slightly better in mathematics.
5. A significant number of students were identified as at-risk based on low scores in one or more subjects.

Recommendations

1. Increase participation in test preparation programs.
2. Provide extra support and mentoring for at-risk students.
3. Encourage greater parental involvement in student learning.

Conclusion

Student performance is influenced by both academic preparation and family background. Focused support programs and early intervention can help improve overall student outcomes and reduce the number of at-risk students.
